

Resilients' Mathematical Arts Workshop Splinterfields FoAM

"To me the simple act of tying a knot is an adventure in unlimited space. A bit of string affords the dimensional latitude that is unique among the entities [...] another dimension is added which provides an opportunity that is limited only by the scope of our own imagery and the length of a ropemaker's coil."

--Clifford W Ashley, The Book of Knots.

Tim Boykett, Carole Collet, Nik Gaffney, Dave Griffiths

Objectives:

to intertwingle a traditional craft, an abstract description and a contemporary practice to enhance mutual understanding

to produce a series of theoretical and physical experiments that explore the connections between mathematics and textiles

to produce a map of possibilities

things that think:

mirror images

splicing and symmetry

image source unknown

braids

top to bottom

Braids generalise symmetric groups to include memory.

All knots can be made as closed braids.

FIGURE 66.
Plaiting a three-ply braid rope.

macramé

knot and math

Unique up to deforming them.
Topological ideas.

How many knots are there?

Alternating knots as woven tangles.

image source unknown

net knot

Anchor hitches at the boundary.

Sheet bends elsewhere.

Emergent shape from length changes.

Hyperbolic, conic and other shapes.
